FOREWORD

Intensive agricultural practices relying heavily on chemical pesticides are a major cause of wide spread ecological imbalances resulting in serious problems of insecticide resistance, pest resurgence, pest replacement and pesticide residues. There is a growing awareness world over of the need for promoting environmentally sustainable agriculture practices.

Integrated Pest Management (IPM) is a globally accepted strategy for promoting sustainable agriculture. There is a conscious shift from the reliance on economic threshold level and chemical pesticides driven approaches in the past to more ecologically sustainable Agro-Eco System Analysis (AESA) based IPM strategies. These focus on the relationship among various components of an agro-ecosystem with special focus on pest-defender dynamics, innate abilities of plant to compensate for the damages caused by the pests and the influence of abiotic factors on pest buildup. In addition, Ecological Engineering for pest management - a new paradigm to enhance the natural enemies in an agro-ecosystem, is being considered as an important strategy. The ecological approach stresses the need for relying on bio intensive strategies prior to use of chemical pesticides.

Sincere efforts have been made by resource personnel to incorporate AESA based principles and field proven technologies for guidance of the extension officers to educate, motivate and guide the farmers to adopt AESA based IPM strategies, which are environmentally sustainable. I hope that these IPM packages will be relied upon by various Central and State government functionaries involved in extension and Scientists of SAUs and ICAR institutions in their endeavour to promote environmentally sustainable agriculture practices.

(Avinash K. Srivastava)
PREFACE

Pests are major biotic constraints to achieve self-sufficiency in ensuring food security. Losses due to pest vary range 10-30% depending upon the genetic constituent of crop, its health and the governing environment. General national estimate of annual crop losses due to pest amounts to ₹260000 million per year. However, negligence of endemic areas can result in complete crop failures. In view of inefficacy of chemical pesticides and environmental problems thereof, Integrated Pest Management (IPM) has been accepted as a cardinal principle of Plant Protection in the overall Crop Protection Programme under the National Agricultural Policy of the Govt. of India. IPM being an eco-friendly approach, socially acceptable and economically viable has been widely accepted across the country. The IPM package encompasses various management strategies for pest and disease problems. Pest monitoring is also one of the important components of IPM to take proper decision to manage any pest problem. It can be done through Agro-Ecosystem Analysis (AESA), field scouting, light, pheromone, sticky/yellow pan traps. The economic threshold level (ETL) of important pests and diseases are also given in the package to activate appropriate control measures on standing crops.

The existing package and practices was developed way back in 2001-02 by DPPQ & S, Faridabad catering the need of extension personals in extending IPM tactics to farmers. Though these were useful, there is a need to update them in view of changing climate and its impact on pests and their protection measures.

A National Workshop on IPM for harmonization of Package of Practices was organized at the National Centre for Integrated Pest Management, New Delhi, during 25-26th Feb., 2013 with a view to provide technical knowledge to the extension functionaries and farmers in the States. The IPM package has been developed with the technical inputs from the experts from the PI (AICRIP), Indian Council of Agricultural Research (NCIPM), State Agricultural Universities, and DPPQ & S, Faridabad.

It will also be useful in reducing the pesticide residues in exportable agricultural commodities and would also help in the management of pests/diseases/weeds/nematodes, which may get inadvertently introduced in the country. These packages will be useful for the researchers, extension workers and farmers alike who are engaged in the agricultural practices.

1. INTRODUCTION

Groundnut (Arachis hypogaea L.), also known as peanut, is a legume that ranks 6th among the oilseed crops and 13th among the food crops of the world. Groundnut is the most important oilseed crop in India, covering nearly half of the area under oilseeds. The vegetable oil is rich in omega-3 fatty acid and extensively used for cooking purpose. In addition to providing high quality edible oil (48-50%), easily digestible protein (26-28%), and nearly half of the 13 essential vitamins and 7 of the 20 essential minerals necessary for normal human growth and maintenance, it produces high quality fodder for livestock. The major growing states are Gujarat, Andhra Pradesh, Tamil Nadu, Karnataka, Rajasthan, and Maharashtra. These constituting and contributing around 80% of area and production. The total area under groundnut is about 8 million hectares and annual production is over 9 million tonnes of pods. Groundnut plays a significant role in the livelihoods of smallholder farmers of rainfed area. In India, groundnut is cultivated during kharif, rabi and summer season under various cropping systems. The national average production of rabi groundnut is higher (1600 kg/ha) than kharif (1000 kg/ha). Rain fed groundnut cultivation coupled with attack by a variety of insect pests and diseases are the major reason for lower productivity. As the crop and its pests are the major reason sensitive to extreme weather events, the crop productivity is determined by the interplay of weather and pests in a given season.

2. BIOTIC CONSTRAINTS

2.1. Major Insect Pests: National Significance
   a. Aphid (Aphis craccivora Koch.)
   b. Bruchids (Caryedon serratus Olivier)
   c. Jassid (Empoasca kerri Pruthi)
   d. Leaf miner (Aproarema modicella Deventer)
   e. Termite (Odontotermes spp.)
   f. Thrips (Scirtothrips dorsalis Hood, Thrips palmi Karny)
   g. Tobacco caterpillar (Spodoptera litura Fabricius)
   h. White grub Lachnosterna (Holotrichia) serrata Fab. and Lachnosterna (Holotrichia) consanguinea Blanchard

2.2. Major Insect Pests: Regional Significance
   a. Bihar Hairy Caterpillar (Spilosoma/Diacrisia obliqua HL & S. obliqua Walk) Punjab
   b. Gram Pod borer (Helicoverpa armigera Hubner) Andhra Pradesh, Tamil Nadu, Karnataka, Gujarat and Goa
   c. Jewel beetle (Chrysochroa fulgidissima Tamamushi) Andhra Pradesh
   d. Red hairy caterpillar (Amsecta albistriga Walker & A. moorei Butttler) Andhra Pradesh, Tamil Nadu and Karnataka
   e. Wire worms (Hapatesus hirtus Candeze) Andhra Pradesh, Tamil Nadu and Gujarat
2.3. Major Diseases: National Importance

a. Alpha-root (*Aspergillus flavus* Link)

b. Alternaria blight (*Alternaria* spp. / *A. arachidis* Kul.) (rabi-summer groundnut)

c. Crown rot/Collar rot (*Aspergillus niger* Tiegh)

d. Dry root rot (*Rhizoctonia bataticola* Taub.)

e. Leaf spot (*Phaeoisariopsis personata* Berk. & Curt. and *Cercospora arachidicola* Hori.)

f. Peanut bud necrosis tospovirus disease (*Peanut bud necrosis virus*)

g. Rust (*Puccinia arachidis* Spegazzini)

h. Stem rot and Pod rot (*Sclerotium rolfsii* Sacc.)

2.4. Major Diseases: National Importance

Peanut stem necrosis disease (PBND)  
Tobacco streak virus (vector-*Thrips* spp.)
A nantapur (A.P.)

2.5. Major Nematodes of National and Regional Importance

1. Root knot nematode  
   (*Meloidogyne arenaria* Chitwood and *M. javanica* Treub)  
   Gujarat, Rajasthan, Bihar, Maharashtra, West Bengal and Punjab

2. Kalahasthi malady (*Tylenchorhynchus brevilineatus* Williams)  
   Parts of Andhra Pradesh

2.6. Major Weeds of National and Regional Importance

3.0. Integrated Pest Management Approach

There are over seventy two (72) definitions of IPM, issued by governments, research organizations, NGOs, and universities (Bajwa and Kogan, 2002). Some assume that IPM will eliminate the use of crop protection products, specially the chemical pesticides, which is most unlikely. Extreme views equating IPM with “pest free” farming will become increasingly marginalised and more balanced views will prevail. There is no reason not to support IPM as defined by the FAO International Code of Conduct on the Distribution and Use of Pesticides (Article 2): Integrated Pest Management (IPM) means a pest management system that, in the context of the associated environment and the population dynamics of the pest species, utilizes all suitable techniques and methods in a compatible manner as possible and maintains the pest populations at levels below those causing economically unacceptable damage or loss (FAO, 1967). Thus, IPM is the best combination of cultural, biological and chemical measures that provides the most cost-effective, environmentally sound and socially acceptable method of managing diseases, insects, weeds and other pests.

IPM is a knowledge-intensive sustainable approach for managing pests by combining compatible cultural, biological, chemical, and physical tools in a way that minimizes economic, health, and environmental risks with the help of pest scouts. IPM relies heavily on knowledge of pests and crop interaction to choose the best combination of locally available pest management tools (Fig. 1). Therefore, IPM is not a single product that can be stored on shelves like pesticide, and it does not rely on single method to solve all our pest problems. Pests also co-evolve and adapt very quickly to single control tactics through natural selection, and that multiple methods used simultaneously, or an “integrated” approach, is the most effective for long-term, sustainable management programs.

IPM is neither organic nor it rely solely on biological control to achieve the desired sustainable outcomes. It does often try to assist and augment the effectiveness of natural enemies by limiting the impact of pesticide on their populations and provide clean and safe niche. It seeks to conserve balance between the crop and the natural environment. The World Bank policy (OP 4.04 - Natural Habitats) also promotes the conservation of natural habitats, and enhancement of the environment for long-term sustainable development.

In the IPM concept, use of pesticides involves a trade-off between pest control and the risks of adverse effects on non-target organisms, such as natural enemies, pollinators, wildlife, and plants, contamination of soil and water.
3.1. Pest Monitoring

3.1.1. Survey/Field Scouting

The objective through roving surveys is to monitor the initial development of pests in endemic areas. Therefore, in the beginning of crop season survey routes based upon the endemic areas are required to be identified to undertake roving surveys. Based upon the results of the roving surveys, the state extension functionaries have to concentrate for greater efforts at block and village levels as well as through farmers to initiate field scouting. Therefore, for field scouting farmers should be mobilised to observe the insect pest and disease occurrence at the intervals as stipulated hereunder. The plant protection measures are required to be taken only when insect pests and diseases cross Economic Threshold Level (ETL) as per results of field scouting.

1. Roving survey: - Undertake roving survey at every 10 km distance at 7-10 days intervals (depending upon pest population). Everyday at least 20 spots should be observed.

2. Field scouting: - Field scouting for pests and bio-control fauna by extension agencies and farmers once in 3-5 days should be undertaken to workout ETL.

3.1.2. Pest monitoring through pheromones/light traps

Majority of insects population can be monitored by fixing and positioning of pheromones or light traps at appropriate stage of crop. Light trap is used to know the abundance and species composition of lepidopteran insect pests in the area to be managed. The light trap is most commonly used tool for obtaining this
information as well as killing of the pests. Use of pheromone traps for monitoring Spodoptera/Helicoverpa and leaf miner. Install pheromone traps at a distance of 50 m @ 5 traps per ha. Use specific lure for each pest species and change it after every 15-20 days. Trapped moths should be removed daily. Yellow sticky traps may be used for monitoring population of whiteflies and jassids.

The State Department of Agriculture can initiate this action at strategic locations at village level as per the following details:

1. **Pheromone trap-monitoring** - 5 traps per ha may be used to monitor moth population.
2. **Light trap** - light trap can be operated for two hours in the evening to observe photo-tropic insect pests.
3. **Sweep-nets** - water pans - Besides visual observations sweep-nets and water pans may also be used to assess the population of insect pests, and biocontrol agents to determine the type of pesticides to be recommended or used.

The objective of pest monitoring is to detect the initial development of pests and diseases and also the bio control potentials in the field situations.

### 3.1.3. Agro Eco System Analysis (A E S A)

IPM has been evolving over the decades to address the deleterious impacts of synthetic chemical pesticides on environment ultimately affecting the interests of the farmers. In modern IPM (FAO, 2002) emphasis is given to Agro Eco System Analysis (A E S A) where farmers take decisions based on larger range of field observations. The health of a plant is determined by its environment which includes physical factors (i.e. sun, rain, wind and soil nutrients) and biological factors (i.e. insect-pests, diseases and weeds). All these factors can play a role in the balance which exists between herbivore insects and their natural enemies. Understanding the intricate interactions in an ecosystem can play a critical role in pest management.

It is an approach, which can be gainfully employed by extension functionaries and farmers to analyse field situations with regard to pests, defenders, soil conditions, plant health, the influence of climatic factors and their interrelationship for growing healthy crop. Such a critical analysis of the field situations will help in taking appropriate decision on management practice. The basic components of A E S A are:

1. Plant health at different stages.
3. Pest and defender population dynamics.
4. Soil conditions.
5. Climatic factors.
6. Farmers past experience.
**AESA Methodology**

Field observations on insect pests and diseases are to be initiated 20 days after sowing. In each field select five spots randomly shown in the figure (four in the corner, at least 5 feet inside the border and one in the centre). At each spot select 10 plants randomly for recording observations.

**Data recording**

Farmers should record data in a notebook and drawing on a chart

- Keep records of what has happened
- Help us making an analysis and draw conclusions

**Data to be recorded**

- Plant growth (weekly)
  - Number of plants
  - Plant height
  - Number of leaves
- Crop situation (e.g. for AESA)
  - Plant health: Observe the crop stage and deficiency symptoms etc.
  - Pests, diseases, weeds: Count insect pests at different places on the plant, and identify any visible disease symptoms and severity. Observe weeds in the field and their intensity. For rats, count number of plants affected by rats.
  - Natural enemies: Count parasitoids and predators
  - Soil condition
  - Irrigation
  - Weather conditions
- Input costs
  - Seeds
  - Fertilizer
  - Pesticides
  - Labour
- Harvest
  - Yield (kg/ha)
  - Price of produce (₹/kg)
Important instructions while taking observations

• While walking in the field, manually collect insects in plastic bags. Use a sweep net to collect additional insects. Collect plant parts with disease symptoms.

• Find a shady place to sit as a group in a small circle for drawing and discussion.

• If needed, kill the insects with some chloroform (if available) on a piece of cotton.

• Each group will first identify the pests, defenders and diseases collected.

• Each group will then analyze the field situation in detail and present their observations and analysis in a drawing (the AESA drawing as shown in MODEL AESA CHART).

• Each drawing will show a plant representing the field situation. The weather condition, water level, disease symptoms, etc. will be shown in the drawing. Pest insects will be drawn on one side. Defenders (beneficial insects) will be drawn on another side.

• Write the number next to each insect. Indicate the plant part where the pests and defenders were found. Try to show the interaction between pests and defenders.

• Each group will discuss the situation and make a crop management recommendation.

• The small groups then join each other and a member of each group will now present their analysis in front of all participants.

• The facilitator will facilitate the discussion by asking guiding questions and makes sure that all participants (also shy or illiterate persons) are actively involved in this process.

• Formulate a common conclusion. The whole group should support the decision on what field management is required in the AESA plot.

• Make sure that the required activities (based on the decision) will be carried out.

• Keep the drawing for comparison purpose in the following weeks.

Weeds types and intensity : 
Rodent damage (if any) : 
No. of insect pests : 
No. of natural enemies : 
Pest : Defender (P: D) ratio : 

Courtesy: NIPHM, Hyderabad
The general rule to be adopted for management decisions relying on the P : D ratio is 2 : 1. However, some of the parasitoids and predators will be able to control more than 2 pests.

Wherever specific P : D ratios are not found, it is safer to adopt the 2 : 1, as P : D ratio. Whenever the P : D ratio is found to be favourable, there is no need for adoption of other management strategies. In cases where the P : D ratio is found to be unfavourable, the farmers can be advised to resort to inundative release of parasitoids/predators depending upon the type of pest. In addition to inundative release of parasitoids and predators, the usage of microbial biopesticides and biochemical biopesticides such as insect growth regulators, botanicals etc. can be relied upon before resorting to synthetic chemical pesticides.

For the success of Integrated Pest Management, pest monitoring, prevention (Cultural and genetic) and timely intervention (Biological or chemical) are the key components.

### 3.2. Cultural practices

a. Deep ploughing in summer to expose soil-borne pathogens, white grubs, nematodes, hibernating defoliators and rhizomes of perennial weeds.

b. Soil application of castor cake/neem cake @ 250 kg/ha against stem rot, collar rot and termite.

c. Rotate the crop with sorghum or pearl millet or rice or maize after kharif crop may reduce the incidence of early leaf spot, late leaf spot, rust and PBND or with wheat/cotton/maize/onion/garlic to reduce the incidence of soil borne pathogens.

d. Intercropping:

   - Groundnut + sorghum
   - Groundnut + pigeonpea
   - Groundnut + pearl millet
   - Groundnut + castor in 3-6:1 ratio to reduce the thrips and PBND.

After groundnut crop is harvested, castor crop is allowed to remain in the field. This gives additional income to the farmers besides acting as a trap crop/indicator crop for Spodoptera (Gujarat, M.P.).
To take care of pests on castor viz. semi looper, capsule borer and hairy caterpillar grow one row of pigeonpea after groundnut. After the harvest of groundnut, pigeonpea is allowed to remain in the fields. For management of *Helicoverpa armigera* use the following methods:

I. Set up pheromone traps @ 5/ha to monitor *Helicoverpa armigera / Spodoptera litura*

II. Conduct AESA weekly. If the pest population is in upward trend without corresponding increase in defender population, take decision on management practices on the basis of AESA as suggested below.

1. Apply HaNPV @ 250 LE/ha or SinPV @ 250 LE/ha or Bt. 1 kg/ha or 5% NSKE when large number of eggs and early instar larvae are noticed.

2. If the above measures are not giving adequate control then apply only safe pesticide at recommended doses.

e. Timely sowing with pre-monsoon showers avoids damage due to white grub and bud necrosis (if protective irrigation is available).

f. Stray plant of cowpea or soybean act as trap crops for leaf miner; castor or sunflower as trap crop for *Spodoptera* hence they need to be removed.

g. In endemic areas, dense cropping (increased seed rate) is advised to reduce bud necrosis damage and weed population.

h. Two hand hoeing at 15-20 days and 30 to 45 days after sowing for effective weed control.

i. Rogue out the virus infected plant like PBNV, PSNV and peanut clump virus from the field.

j. Avoid prolonged drought (>20 days) during pod maturation stage (if irrigation is available) to prevent pre-harvest infection of *Aspergillus flavus* and subsequent aflatoxin contamination.

k. Harvest at optimum maturity stage to avoid pod infection by *A. flavus* (neither immature nor over-matured stage).

l. Dry the pods to optimum kernel moisture level of about 7%.

m. Store in polythene-lined gunny bags on raised platform. The bag should not be sealed or stitched to avoid loss of germination.

**Habitat management**

Ecological pest management has recently emerged as a paradigm for considering pest management approaches that rely on the use of cultural techniques to effect habitat manipulation and to enhance biological control. The cultural practices are informed by ecological knowledge rather than on high technology approaches such as synthetic pesticides and genetically engineered crops.

**Natural enemies may require**

1. Food in the form of pollen and nectar for adult natural enemies.

2. Shelters such as overwintering sites, moderate microclimate, etc are needed.

3. Natural enemies may also require alternate host when primary host are not present.
Habitat management for pest - Above ground

- Raising the flowering plants / compatible cash crops along the field border by arranging shorter plants towards main crop and taller plants towards the border to attract natural enemies as well as to avoid immigrating pest population.
- Growing flowering plants on the internal bunds inside the field.
- Not to uproot weed plants those are growing naturally like Tridax procumbens, Ageratum sp. Alternanthera sp., which act as nectar source for natural enemies.
- Not to apply broad spectrum chemical pesticides, when the P : D is favourable. The plant compensation ability should also be considered before applying chemical pesticides.

Habitat management for pest - Below ground

- Crop rotations with leguminous plants which enhance nitrogen content.
- Keeping soils covered year-round with living vegetation and/or crop residue.
- Adding organic matter in the form of FYM, Vermicompost, crop residue which enhance below ground biodiversity.
- Reducing tillage intensity so that hibernating natural enemies can be saved.
- Applying balanced dose of nutrients using biofertilizers
- Apply mychorrhiza and PGPR
- Applying Trichoderma as seed treatment and Pseudomonas fluorescens as seed, nursery treatment and soil application (If Commercial products are used, check for label claim. However, biopesticides produced by farmers for own consumption in their fields, registration is not required).

Due to enhancement of biodiversity by the flowering plants, parasitoids and predatory natural enemies number also will increase due to availability of nectar, pollen, fruits, insects, etc. The major predators are a wide variety of spiders, lady bird beetles, long horned grasshoppers, Chrysoperla, Earwigs, etc.
## Flowering plants that attract natural enemies/repel pests

**Nectar rich plants with small flowers:** Anise, caraway, dill, parsley, mustard, sunflower, buck wheat and cowpea (wasp) |
| 3     | Pod borer   | **Parasitoids:** Trichogramma chilonis (egg), Tetrastichus spp. (egg), Telenomus spp. (egg), Chelonus blackburni (egg-larval), Carcelia spp. (larval-pupal), Campoletis chlorideae (larval), Goniophthalmus halli (larval), Bracon spp. (larval) etc.  
**Predators:** Chrysoperla carnea, coccinellids, King crow, common mynah, wasp, dragonfly, spider, robber fly, reduviid bug, praying mantis, fire ants, big eyed bugs (Geocoris sp.), pentatomid bug (Eocanthecona furcellata), | **Repellent plants:** Basil  
**Attractant plants:** Carrot family, sunflower family, buck wheat, alfalfa, corn, shrubs (minute pirate bug and lacewing)  
Nectar rich plants with small flowers: Anise, caraway, dill, parsley, mustard, sunflower, buck wheat and cowpea (wasp) |
| 4     | Tobacco Caterpillar | **Parasitoids:** Trichogramma chilonis (egg), Tetrastichus spp. (egg), Telenomus spp. (egg), Chelonus blackburni (egg-larval), Carcelia spp. (larval-pupal), Campoletis chlorideae (larval), Eriborus argentipilosus (larval), Micropeltis sp. (larval) etc.  
**Predators:** Chrysoperla carnea, coccinellids, King crow, common mynah, wasp, dragonfly, spider, robber fly, reduviid bug, praying mantis, fire ants, big eyed bugs (Geocoris sp.), pentatomid bug (Eocanthecona furcellata), Ovomermis albicans, a nematode | **Repellent plants:** Basil  
**Attractant plants:** Carrot family, sunflower family, Malvaceae family, buck wheat, alfalfa, corn, shrubs (minute pirate bug and lacewing)  
Nectar rich plants with small flowers: Anise, caraway, dill, parsley, mustard, sunflower, buck wheat and cowpea (wasp) |
### 5. Jassids

**Parasitoids:** Lymaenon empoascae (egg), *Anagrus flavoelus*, *Stethynium triclavatum*

**Predators:** Lady beetle, ants *Distina albino*, *Chrysoperla* spp., mirid bug (*Dicyphus hesperus*), big-eyed bug (*Geocoris* sp.) etc.

- Sunflower family, alfalfa (damsel bug & minute pirate bug)
- Carrot family, buck wheat, alfalfa, corn, shrubs (minute pirate bug)

### 6. Aphids

**Parasitoids:** *Aphidius colemani*, *Diaeretiella* spp., *Aphelinus* spp. etc.

**Predators:** Anthocorid bugs/pirate bugs (*Orius* spp.), mirid bugs, syrphid/hover flies, green lacewings (*Mallada basalis* and *Chrysoperla carnea*), predatory coccinellids (*Stethorus punctillum*), staphylinid beetle (*Oligota* spp.), predatory cecidomyiid fly (*Aphidoletis aphidimyza*) and predatory gall midge, (*Feltiella minuta*), earwigs, ground beetles, rove beetles, spiders, wasps etc.

- Carrot family, sunflower family, marigold, buckwheat, spear mint (syrphid fly, lacewing, minute pirate bug, damsel fly and lady beetle), French bean (predatory thrips), Strips of Rye grains, cover crops and mulch beds (rove beetle) Mustard, sweet clove, dill (aphid midge, *Aphidoletes aphidimyza*)
- Nectar rich plants with small flowers i.e. anise, caraway, dill, parsley, mustard (aphid parasite and braconid wasp), Sunflower, buckwheat and cowpea (braconid wasp)

### 7. White grubs

**Parasitoids:** Braconids, Trichogrammatids,

**Predators:** dragon flies, Viral & Fungal pathogens NPV, green muscardine fungus.

**Repellent plants:** Basil

**Attractant plants:** Carrot family, sunflower family, buck wheat, alfalfa, corn, shrubs (minute pirate bug and lacewing)

**Nectar rich plants with small flowers:** Anise, caraway, dill, parsley, mustard, sunflower, buck wheat and cowpea (wasp)

### 3.3. Genetic management

Use of varieties with resistance to insect pest and diseases are given below:

| Resistance to rust and late leaf spot | ICG FDRS 10, ICGV 86590, R 8808, R 9201 |
| Field tolerant to Bud Necrosis under Rabi/Summer situation | ICGS 11(ICGV 87123), ICGS 44 |
| Nematode tolerance (Kalahasthi malady) | Tirupati 2, Tirupati 4 |
| Pest resistance | Gimarl (J assid), ICGV 87160 (Aphids), Kadiri 3, BG 2 (Spodoptera) |

(Source: Dr B B Singh, ADG (OP), ICAR, Krishi Bhawan, New Delhi-12)

*Maturity group: early=less than 110 days; medium=111 to 120 days; late= more than 120 days
ELS= Early Leaf Spot; LLS= Late Leaf Spot and virus; PBND= Peanut Bud Necrosis Disease
Small seed= less than 35g/100 seed; medium seed= more than 35 to 45g/100 seed; large seed= more than 45g/100 seed*
3.4. Mechanical Practices

a. Installation of 12 light traps/ha or bonfire against red hairy caterpillar (RHC) in endemic areas.
b. Collection and destruction of egg masses and early instar larva of S. litura, RHC and Bihar hairy caterpillar
c. Collection and destruction of white grub beetles from jujube or neem trees around the field, immediately after the early rains.
d. Installation of pheromone traps @ 5/ha for monitoring and trapping of S. litura and H. armigera
e. Trenching and destruction of migrating larvae of hairy caterpillar.
f. Remove the collateral host during the season.
g. Use of aggregating pheromones on the preferred host of white grub beetle on community basis.

3.5. Biological control of insects/diseases

a. Seed treatment with Trichoderma viride @ 10 g/kg seed for controlling of soil borne diseases like collar rot, root rot and stem rot.
b. Soil application of Trichoderma viride @ 10 kg/ha multiplied in 250 kg FYM, 15 days prior to its application and applied at the time of sowing.
c. Release of Telenomus remus @ 50000/ha in 4 times (7-10 days interval) against defoliators (tobacco caterpillar) based on pheromone trap catching.
d. Use S. litura NPV @ 250 LE (6 x 10^9/LE)/ha or Bt @ 1 kg/ ha when large number of egg masses and early instar larva are noticed.
e. Use 5% neem seed kernel extract against S. litura, leaf miner and foliar diseases on need basis.
f. Augment the release of Cheilomenes sexmaculata (Fabricius), @ 1250/ha against Aphis craccivora.
g. Release of Bracon hebetor @ 5000/ha in 2 times at 7- 10 days interval against leaf miner and defoliators.
h. Release of larval parasitoid Apanteles african @ 5000/ha.
i. Conserve the natural bio control population of anthocorids, damsel bugs, assassin bug, predatory pentatomid bugs, lady bird beetles, ground beetles, rove beetles, hover flies, robber flies, preying mantids, green and brown lacewings, spiders, vespidae, damsel flies, dragon flies, tachnid flies, Ichneumonid wasps, Braconid wasps, Trichogrammatid wasps and beneficial pathogen like Nuclear Polyhedrosis Virus by use of less toxic pesticides.
j. EPN can be recommended @ one billion per acre for the management of white grub (Holotrichia serrata).
k. Apply entomopathogenic nematodes (EPNs) @ 20-120 crore infective juveniles of Steinernema feltiai/acre for the management of red hairy caterpillar (Amsacta sp.)
Potential natural enemies of groundnut insect pests

</tbody>
</table>
3.6. Chemical control

a. Seed treatment with Chlorpyrifos 20% EC @ 2.5 to 12.5 ml/kg seed in endemic areas against white grub.

b. Two spray of Difenaconazole 25% @ 100 g/100 lit. of water or Propiconazole 25% EC @ 500 g/750 lit. of water or Hexaconazole 5% EC @ 1500 ml/500 lit. of water at 15 days interval after appearance of diseases for leaf spots and rust.

c. Use 0.005% Bromadiolone cake as a bait for rodent control.

d. Soil application of phorate 10% CG @ 15-25 kg/ha for aphids, leaf miner and white grub or Carbofuran 3% CG @ 33.3 kg/ha against white grub and other soil borne insect pest.

e. Need based application of Dimethoate 0.05% or Monocrotophos 0.05%, or Imidacloprid 0.008% or Dichlorovos 76% SC for managing sucking pests of groundnut.

f. Spray Quinolphos 25% EC 0.05% or Chlorpyrifos 20% EC for managing defoliators like Spodoptera and Helicoverpa.

3.7. Weed management

3.7.1. Cultural and mechanical practices

a. Summer deep ploughing of fields for destroying the underground vegetative parts of perennial weeds.

b. Two mechanical weeding each at 15-20 days and 30-45 days after sowing to keep the crop weed free for 6 weeks.

3.7.2. Chemical control

a. Apply Oxyflourfen 23.5% EC @ 425-850 g/500 lit. of water or Alachlor 50% EC @ 1.5 -2.5 kg/250-500 lit. of water or Alachlor 10% GR @15-25 kg/ha after sowing but before emergence of weeds.

b. Use of post- emergence weedicides like Imazethapyr 10% SL @ 1.0-1.5 lit/500-700 lit. of water or Quizalofop ethyl 5% EC @ 750-1000 g/500 lit. of water for grass and broad leaf weeds.

3.8. Managements of nematode pests

Major species Root knot nematodes (Meloidogyne arenaria, M. javanica) and Kalahasthi Malady (Tylenchorhynchus brevilineatus)

Minor species Lesion nematodes (Pratylenchus spp.)

3.8.1. Cultural and mechanical practices

a. Deep summer ploughing: Plough the soil down to a depth of minimum 20 cm. in the hot summer months to expose the soil to solar radiation. The nematodes die due to desiccation. This practice can be coupled with summer fallow to make it more effective.
b. Use of resistant varieties

<table>
<thead>
<tr>
<th>Nematode</th>
<th>Variety</th>
</tr>
</thead>
<tbody>
<tr>
<td>i. Kalahasthi malady</td>
<td>Kadiri-3, Tirupati 2 and Tirupati 3</td>
</tr>
<tr>
<td>ii. M. javanica</td>
<td>G 201, CGC 4018, Japtin 220 -15, Ambali</td>
</tr>
<tr>
<td>iii. Pratylenchus sp.</td>
<td>P - 1295233, P - 1290606.</td>
</tr>
</tbody>
</table>

3.8.2. Management of Kalahasthi malady

a. Crop rotation with paddy or other cereal crops like sorghum and maize. Rotation with paddy is very effective in reducing the population of Kalahasthi nematode. Rotation with maize or sorghum reduces root knot nematode population.

b. Green manuring and incorporation of organic manure to the soil can help in minimizing the Kalahasthi and root knot nematodes.

c. Quarantine regulations need to be strictly monitored to check the entry of Aphelenchoides arachidis and Belonolaimus longicaudatus.

3.8.3. Management of root knot nematode

a. Deep summer ploughing in states having hot and dry summers help in reducing infestation of plant parasitic nematodes.

b. Soil amendments with neem cake or castor cakes @ 1 tonne/ha preferably seven days prior to sowing has been found to reduce nematode population.

c. Farmers of south Saurashtra region of Gujarat are advised to sow groundnut with castor as an intercrop (2:1 ratio) along with soil application of Carbofuron @ 1kg a.i/ha to reduce the population of root-knot nematodes infecting groundnut.

d. EPN recommendation for management of insect pests in ground nut.

3.9. Management of rodents

Lesser bandicoot: Bandicota bengalensis (Gray) (throughout India)

Field mouse: Mus booduga (Gray) (throughout India)

Soft furred field rat: Millardia meltada (Gray) (throughout India)

Indian Gerbil: Tatera indica (Hardwicke) (throughout India)

Brown spiny mouse: Mus platythrix (Bennett)

Rodent damage in groundnut

- Rodents cause damage to germinating seeds by nibbling
- Maximum damage is found during the pod formation and maturity.
- Rodents will make the burrow near the plant base, cut the roots and pods and eat the seeds from developed pods. Fat content in the seeds attract the rats and leads to losses. Due to root damage sometimes plants also withers.
Management practices

- Plough the fields to demolish the rodent habitat and maintain weed free fields to reduce alternate source of food and habitat.
- Practice burrow smoking using natural smoking materials in ANGRAU/ NIPHM burrow fumigant for 2-3 min. for each burrow.
- Application of 0.005% bromadiolone in ready to use form (wax blocks) or loose bait in packets near rodent burrows.
- Apply 2% Zinc phosphide poison baits when the rodent infestation is very high.

4.0. Crop stage/pest vis-a-vis IPM practices

</tr>
</thead>
<tbody>
<tr>
<td>SlNPV</td>
<td>250 LE. /ha</td>
<td>on need basis.</td>
</tr>
<tr>
<td>B.t. 1 kg</td>
<td></td>
<td>on need basis.</td>
</tr>
</tbody>
</table>

### Mechanical practice

- Collect egg masses and early instar larvae of *S. litura*.
- Spray of neem based formulations @ 2%.

### 5. Peg & Pod formation

**Mechanical practice**

- Collect egg masses and early instar larvae of *S. litura*.
- Spray of neem based formulations @ 2%.

**Biological control**

- Spray SlNPV @ 250 LE. /ha or B.t. 1 kg/ha on need basis.

### Chemical control

- Spray of Dimethoate 30% EC @ 470-940 g/500-1000 liter of water for controlling the leaf miner. Spray Quinolphos 25 EC 0.05% or Chlorpyrifos 20 EC for managing Spodoptera. Two spray of Difenaconazole 25% EC @ 100 ml/100 liter. of water or Propiconazole 25% EC @ 500 g/750 liter. of water or Hexaconazole 5% EC @ 1500 ml/500 liter. of water at 15 days interval after appearance of diseases for leaf spots and rust.

### 6. Maturity stage

**Chemical control**

- No chemical control as this action may leave pesticides residues in the harvested produce.
- Use 0.005% Bromadiolone cake.

### 7. Harvest & Storage

**Cultural practices**

- Store in polythene - lined gunny bags on raised platform. The bag should not be sealed or stitched to avoid loss of germination.
- Dry the pods to optimum kernel moisture level to optimum level of about 7%.
- Harvest at optimum maturity state to avoid pod infection by *A. flavus* (neither immature nor over-matured).

**Chemical control**

- In case of Bruchids infection, fumigates with Aluminium phosphide one tablet (3g)/30 kg bag under air tight condition.
5.0. Safety parameters

Annexure deals with the safety parameters inter-alia classification of toxicity as per Insecticides Rules, 1971, WHO Classification of hazards, colour of toxicity triangle, first aid measures, symptoms of poisoning and treatment of poisoning, the extension functionaries of the State Department of Agriculture have to make use of this information as under:

I. Basic precautions which are required to be taken as per classification of toxicity as well as hazard criteria by WHO.

II. The extension functionaries are to educate the farmers on safety use of pesticides with the help of colour toxicity triangle as the farming community can follow the colour and corresponding safety precautions.

III. The symptom of poisoning must be known to the extension functionaries to enable them to extend first aid measures to affected persons to the extent possible.

IV. Basically, the information on first aid measures and treatment of poisoning is required to be passed on by the extension functionaries to the doctors at Primary Health Centres as well as to the Private Doctors in the vicinity of spraying of pesticides.

V. Extension functionaries must ensure that names of common pesticides during plant protection measures along with a copy of the leaflet which is an integral part of a pesticide container must be made available to the doctors in the vicinity of plant protection operations.

VI. Extension functionaries are to request the doctors to intervene in procurement of antidotes for different pesticides as cited under “Treatment of poisoning”.

### Do's and don’ts in groundnut IPM

<table>
<thead>
<tr>
<th>Sl. No.</th>
<th>Do's</th>
<th>Don’ts</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Deep ploughing is to be done on bright sunny days during the month of May and June. The field should be kept exposed to sun light at least for 2-3 weeks.</td>
<td>Do not plough or irrigate the field after ploughing at least for 2-3 weeks to allow desiccation of weed's bulbs and/or rhizomes of perennial weeds.</td>
</tr>
<tr>
<td>2.</td>
<td>Grow only recommended varieties</td>
<td>Do not grow varieties not suitable for the season or the region.</td>
</tr>
<tr>
<td>3.</td>
<td>Prefer to sow the crop from April to May for North Zone and up to June end for South and Central Zones.</td>
<td>Avoid late sowing as this may lead to reduced yield and incidence of white grubs and diseases.</td>
</tr>
<tr>
<td>4.</td>
<td>Always treat the seeds with approved chemicals/bio products for the control of seed borne diseases/pests.</td>
<td>Do not use seeds without seed treatment with biocides/chemicals.</td>
</tr>
<tr>
<td>5.</td>
<td>Sow in rows at optimum depths under proper moisture conditions for better establishment</td>
<td>Do not sow seeds beyond 5-7 cm depth.</td>
</tr>
<tr>
<td>6.</td>
<td>Pre-emergence herbicides should be applied immediately after sowing before the emergence of weeds and crop.</td>
<td>Pre-emergence herbicides should not be applied after emergence of crop and/or weeds they cannot control the germinated weeds as well as they may cause phytotoxicity to the crop.</td>
</tr>
<tr>
<td>7.</td>
<td>Herbicides like Oxyfluorfen/Alachlor should be incorporated into the soil immediately after spraying, to avoid its photodegradation.</td>
<td>Soil application of Oxyfluorfen/Alachlor should not be delayed or avoided for achieving effective weed control.</td>
</tr>
<tr>
<td>8.</td>
<td>Always recommended herbicides at recommended dose, proper time, as appropriate spray solution with standard equipment along with fan or flat jet nozzles.</td>
<td>Pre-emergence as well as soil incorporation of herbicides should not be done in dry soils. Do not apply herbicides along with irrigation water or by mixing with soil, sand or urea.</td>
</tr>
<tr>
<td>9.</td>
<td>Maintain optimum and healthy crop stand which would be capable of competing with weeds at a critical stage of crop weed competition.</td>
<td>Crops should not be exposed to moisture deficit stress at their critical stage growth stages.</td>
</tr>
<tr>
<td>10.</td>
<td>Use NPK fertilisers as per the soil test recommendations.</td>
<td>Avoid imbalanced use of fertilisers</td>
</tr>
<tr>
<td>11.</td>
<td>Use micronutrient mixture after sowing as top dressing separately.</td>
<td>Do not mix micronutrients with fertilisers and incorporate into the soil.</td>
</tr>
<tr>
<td>12.</td>
<td>Conduct AESA weekly in the morning preferably before 9 am. Take decision on management practice based on AESA, ETL, and P:D ratio only.</td>
<td>Do not apply chemical pesticides on calendar basis.</td>
</tr>
</tbody>
</table>
### Method for calculation of pesticides for application

(i) **Solid formulations** such as dust, wettable powder or granules, the active ingredient is mixed with inert material. The concentration is expressed as -

\[
\text{Active ingredient (\%) in the total weight of commercial product} = \frac{\text{Weight of a.i.}}{\text{Total weight of WP, dust, etc.}} \times 100
\]

Example. Carbendazim 50% WP means there are 50 g of carbendazim in every 100 g of commercial WP (50% a.i.).

**Calculations when recommendation is in kg a.i. ha\(^{-1}\).** For WP, dust, granules, etc.

**Specification required:**

1. Area to be sprayed
2. Concentration of a.i. in formulation
3. Recommended rate as kg a.i. ha\(^{-1}\).

**Formula:**

\[
\text{kg of WP/dust/ granules} = \frac{\text{Recommended rate} \times \text{spray area (sq.m)}}{\text{a.i. (%) in WP}} \times 100
\]

Example: If Carbendazim 50% WP is used at the rate of 2 kg a.i. ha\(^{-1}\), then amount of Carbendazim 50% WP required for 1 ha (10000 m\(^2\)) is:

\[
\text{kg of Carbendazim 50% WP required} = \frac{2 \times 10000}{50 \times 100} = 4 \text{ kg/ha}
\]

(ii) **Liquid formulation:** Here the a.i. is dissolved in a solvent with an emulsifying agent. It is expressed as in emulsifiable concentrate (EC). The concentration can be expressed in two ways.

\[
\text{a) Active ingredient (\%) in EC} = \frac{\text{Weight of a.i.}}{\text{Volume of EC}} \times 100
\]
b) Grams L\(^{-1}\)

Example: Hexaconazole 5% EC means, 100 ml of commercial product has 5 ml of pure Hexaconazole

**For emulsifiable concentrates**

**Specification required:**

i) Area to be treated

ii) Recommended rate as kg a.i. ha\(^{-1}\)

iii) Concentration of commercial EC as a.i. (%) or kg L\(^{-1}\)

**When concentration of EC is in a.i. (%)**

**Formula:**

\[
\text{kg of EC required} = \frac{\text{Recommended rate} \times \text{area (m}^2\text{)}}{\text{a.i.} \text{ (%) in commercial EC} \times 100}
\]

\[
= \frac{\text{Recommended rate} \times \text{area (ha)}}{\text{a.i.} \text{ (%) in commercial EC} \times 100}
\]

**Example:** Hexaconazole 5% EC to be sprayed at the rate of 2 kg a.i. ha\(^{-1}\) for 10000 m\(^2\) and Hexaconazole 5% EC has 5% a.i. How much liters of Hexaconazole is required?

\[
\text{Liters of 5% Hexaconazole required} = \frac{2 \times 10000}{5 \times 100} = 40 \text{ L}
\]

**When concentration expressed is in kg a.i. L\(^{-1}\)**

**Formula:**

\[
\frac{\text{Recommended rate in kg a.i. ha}^{-1} \times \text{area (ha)}}{\text{Concentration of a.i. in product (kg L}^{-1}\text{)}}
\]

**Example:** Acetamprid (0.01 kg a.i. L\(^{-1}\)) is to be applied at the rate of 0.05 kg a.i. ha\(^{-1}\) How much will be required for 3 ha?

\[
\text{Liters of Acetamprid required} = \frac{0.05 \times 3.0}{0.01} = 15 \text{ liters}
\]

**When recommendation is based on a.i. (%) in the spray fluid**

i) **Wettable powders (when diluted with water)**

**Specifications required:**

1 Spray volume as L ha\(^{-1}\)
2 Concentration desired as a.i. (%) in spray
3 Concentration of commercial product as a.i. (%)
**Formula:**

\[ WP = \frac{\text{a.i. (\%) desired} \times \text{spray volume}}{\text{a.i. (\%) in commercial WP}} \]

**Example:** To control Spodoptera in a plot, 2000L of 2% Methyl Parathion DP is to be prepared. The commercial product to be used is Methyl parathion 50% EC. How much Methyl parathion is required?

\[ \text{Litre of Methyl parathion required} = \frac{2 \times 2000}{50} = 80 \text{ liters} \]

**ii) Emulsifiable concentrates (EC)**

**Specification required:**

1) Spray volume as L ha\(^{-1}\)
2) Concentration as percentage of a.i desired.
Concentration of commercial EC as a.i. (%).

**Formula:**

\[ \text{Liter of EC} = \frac{\text{a.i. (\%) desired} \times \text{spray volume}}{\text{a.i. (\%) in commercial EC}} \]

**Example:** 2000 L of 2% Quinalphos 25% EC spray is to be prepared. How much commercial 25% EC is required?

\[ \text{Liters of Methyl Parathion} = \frac{2 \times 2000}{25} = 160 \text{ L} \]

### Annexure-II

#### Commonly Available Formulations of Pesticides for Agricultural Use

<table>
<thead>
<tr>
<th>Class</th>
<th>Type</th>
<th>Abbreviation</th>
<th>Description</th>
</tr>
</thead>
</table>
| Dry         | Dust             | D            | • Ready to use, off shelf available  
• Low percentage of active ingredients,  
• Very fine dry inert carrier made from tale, chalk, clay, or ash  
• Prone to high level of pesticide drift |
|             | Granule          | G            | • Granule particles are larger and heavier  
• Used for soil treatment and broadcasting to manage nematodes, weeds and insect pests |
| Wetable     |                  | WP           | • Finely grounded power                                                                      |
| Powder      |                  | W            | • Finely grounded power                                                                      |
| Micro       | Encapsulated     | M            | • Mixed with water for spray application                                                      |
| Liquid      | Emulsifiable     | EC           | • Particles of active ingredients (liquid or dry) surrounded by a plastic coating              |
| Concentrate | solution         | C            | • Liquid active ingredients, dissolved in petroleum based solvents  
• Easily absorbed through skin                                                             |
| ULV         |                  |              | • Diluted with a liquid solvent before being applied                                            |
| Fumigants   | Pellets          | F            | • Very high percentage of active ingredient  
• Used before dilution or diluted with small quantities of solvent                           |
| liquids     |                  | L            | • Finely grounded solid active ingredients suspended in the liquid with inert materials     |
|             |                  |              | • Solid or liquid that releases/vaporized into toxic gasses                                   |

General Guidelines for Management of Resistance

The general guidelines if adopted can prevent development of resistance by various pests in most of the agricultural situations. The general approaches to avoid them are as follows:

**Insecticides**

- Maintain good plant health,
- Delay the spray of insecticide as far as possible.
- Monitor populations and use economic thresholds
- Use all available tactics for management of a particular arthropod (insect or mite)
- Limit selection pressure throughout the season and remember spraying for one pest may influences another
- Limit use of one chemical molecule at a time and rotate chemical molecule and/or modes of action, and
- Use appropriate rates

**Fungicides**

- Avoid growing large areas of highly susceptible varieties in endemic areas. Resistant varieties should be used to reduce reliance on chemical pesticides.
- Make full use of non-fungicidal control measures e.g., dispose of crop debris and control collateral and alternate host, which harbor disease.
- Monitor crops regularly for disease and treat before the infection becomes established.
- Use fungicides only in the unavoidable situations where the risk of disease warrants treatment. Make full use of effective fungicides with different modes of action as alternate sprays. Mixtures of eradicant fungicides with protectants materials offer the most flexibility as well as reducing resistance risk.
- While formulating spray programmes, take into account any earlier use of fungicides groups as seed treatment.
- Do not exceed the maximum recommended numbers of applications to each crop for any particular fungicide group. Avoid repeated applications of very low doses.
### Pesticides / formulations banned in India (As on 1st Jan, 2014)

Annexure – VIII

Basic Precautions in Pesticide Usage

A. Purchase
1. Purchase only JUST required quantity e.g. 100, 250, 500 or 1000 g/ml for single application in specified area.
2. Do not purchase leaking containers, loose, unsealed or torn bags.
3. Do not purchase pesticides without proper/approved LABELS.

B. Storage
1. Avoid storage of pesticides in the house premises.
2. Keep only in original container with intact seal.
3. Do not transfer pesticides to other container.
4. Never keep them together with food or feed/fodder.
5. Keep away from the reach of children and livestock.
6. Do not expose to sun-light or rain water.
7. Do not store weedicides along with other pesticides.

C. Handling
1. Never carry/transport pesticides along with food materials.
2. Avoid carrying bulk - pesticides (dusts / granules) on head, shoulders or on the back.

D. Precautions for Preparing Spray Solution
1. Use clean water.
2. Always protect your NOSE, EYES, MOUTH, EARS and HANDS.
3. Use hand gloves, face mask and cover your head with cap.
4. Use polyethylene bags as hand gloves, handkerchiefs or piece of clean cloth as mask and a cap or towel to cover the head (Do not use polyethylene bag contaminated with pesticides).
5. Read the label on the container before preparing spray solution.
6. Prepare spray solution as per requirement.
7. Do not mix granules with water.
8. Concentrated pesticides must not fall on hands etc. while opening sealed containers. Do not smell the sprayer tank.
9. Avoid spilling of pesticide solution while filling the sprayer tank.
10. Do not eat, drink, smoke or chew while preparing solution.
11. The operator should protect his bare feet and hands with polyethylene bags.

E. Equipments
1. Select right kind of equipment.
2. Do not use leaky, defective equipment.
3. Select right kind of nozzle.
4. Don’t blow/clean clogged- nozzle with mouth. Use old tooth- brushes tied with the sprayer and clean with water.
5. Do not use same sprayer for weedicide and insecticide.

F. Precautions for applying pesticides
1. Apply only at recommended dose and dilution.
2. Do not apply on hot sunny day or strong windy condition.
3. Do not apply just before the rains and also after the rains.
4. Do not apply against the wind direction.
5. Emulsifiable concentrate formulations should not be used for spraying with battery operated ULV sprayer.
6. Wash the sprayer and bucket etc with soap water after spraying.
7. Containers, buckets etc. used for mixing pesticides should not be used for domestic purposes.
8. Avoid entry of animals and workers in the fields immediately after the spraying.

G. Disposal
1. Left over spray solution should not be drained in ponds or water lines etc. Throw it in barren isolated area, if possible.
2. The used/empty containers should be crushed with a stone / stick and burned deep into soil away from water source.
3. Never re-use empty pesticide container for any purpose.
# Classification of pesticide with symptom of poising and treatment

<table>
<thead>
<tr>
<th>S. No</th>
<th>Name of pesticide</th>
<th>Classification as per Insecticides Rules, 1971</th>
<th>Colour of Toxicity Triangle</th>
<th>WHO classification by hazard</th>
<th>First aid measures</th>
<th>Symptoms of poisoning</th>
<th>Treatment of poisoning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>1</strong></td>
<td>Phorate</td>
<td>Extremely toxic</td>
<td>Red</td>
<td>Class Ia - Extremely hazardous</td>
<td>Remove the person from the contaminated environment. In case of (a) Skin contact- Remove all contaminated clothings and immediately wash with lot of water and soap; (b) Eye Contamination – Wash the eyes with plenty of cool and clean water; (c) Inhalation- Carry the person to the open fresh air, loosen the clothings around neck and chest; and (d) Ingestion – if the victim is fully conscious, induce vomiting by tickling back of the throat. Do not administer milk, alcohol and fatty substances. In case the person is unconscious make sure the breathing passage is kept clear without any obstruction. Victim’s head should be little lowered and face should be turned to one side in the lying down position. In case of breathing difficulty, give mouth to mouth or mouth to nose breathing. Medical aid: Take the patient to the doctor / primary health centre immediately along with the original container, leaflet and label.</td>
<td>Mild – Anorexia, Head ache, dizziness, weakness, anxiety, tremors of tongue and eyelids, miosis, impairment of visual acuity.</td>
<td>For extreme symptoms of O.P. poisoning, injection of atropine (2-4 mg for adult, 0.5-1.0 mg for children) is recommended, repeat at 5-10 minute intervals until signs of atropinisation occurs. Speed is imperative - Atropine injection 1-4mg, repeat 2mg when toxic symptoms begin to recur (15-16 minute intervals). Excessive salvation - good sign, more atropine needed; Keep airways open, Aspirate, use oxygen, insert endotracheal tube. Do tracheotomy and give artificial respiration as needed.</td>

- Atropine injection 1 to 4 mg, repeat 2 mg when toxic symptoms begin to recue (15-60 minute intervals). Excessive salvation- good sign, more atropine needed. Keep airway open. Atropine, use oxygen, insert endotracheal tube. Do tracheotomy and give artificial respiration as needed. - For ingestion, lavage stomach with 5% sodium bicarbonate, if not vomiting. For skin contact was with soap and water (eye- wash with isotonic saline), wear rubber gloves while washing contact area. - Oxygen - Morphine, if needed. Avoid theophylline and aminophylline or barbiturates. 2PAM and other oximes are not harmful and in fact contra indicated for routine usage. Do not give atropine to a cyanotic patient, give artificial respiration first then administer atropine.

<td>Bleeding from nose, gums and into conjunctiva, urine, stool and coma. Possible polar and petechial rash, late massive ecchymosis or hematoma of skin, joints, brain haemorrhage. Give vitamin K1 15-25 mg for adults; 5-10 mg for children orally. Transfuse with fresh blood if bleeding is severe or until anaemia is corrected. Iron (ferrous sulphate) by mouth for correction of secondary anaemia, 0.3 hg t.i.d.</td>

Plate I: Important diseases and their field symptoms

- Seed rot
- Collar rot
- Alpha root
- Rust-brown colour pustule
- Early leaf spot
- Late leaf spot
- Stem rot (white mycelia)
- Stem rot (brown sclerotia)
Plate II: Key insect pests and their field symptoms

Aphids on leaves
Jassid adults

Yellowing and V shaped necrosis caused by Jassid
Larvae of Spodoptera

Damage caused by leaf miner
Larvae of red hairy caterpillar

Symptoms due to red hairy caterpillar
Symptoms of thrips damage
Plate III: Natural enemies of groundnut pest

Symptoms caused by root knot nematode

Grub of Coccinellid beetle

Adult Coccinellid beetle feeding on aphids

Spider

Adult parasitoid

Bacteria infected larvae

Fungus infected larvae
